Ranked IR

Instructor:
Walid Magdy

Assignment Project Exam Help

14-Oct-2020

1

<https://powcoder.com>

Lecture Objectives

- Learn about Ranked IR
 - TFIDF
 - VSM
 - SMART notation
- Implement:
 - TFIDF

2

Boolean Retrieval

- Thus far, our queries have all been Boolean.
 - Documents either: “match” or “no match”.
- Good for expert users with precise understanding of their needs and the collection.
 - Patent search uses sophisticated sets of Boolean queries and check hundreds of search results
(car OR vehicle) AND (motor OR engine) AND NOT (cooler)
- Not good for the majority of users.
 - Most incapable of writing Boolean queries.
 - Most don't want to go through 1000s of results.
 - This is particularly true for web search
 - Question: What is the most trusted web-search feature?

Ranked Retrieval

Add WeChat powcoder

- Typical queries: free text queries
- Results are “ranked” with respect to a query
- Large result sets are not an issue
 - We just show the top k (≈ 10) results
 - We don't overwhelm the user
- Criteria:
 - Top ranked documents are the most likely to satisfy user's query
 - Score is based on how well documents match a query
Score(d, q)

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

4

Old Example

- Find documents matching query {ink wink}
 - Load inverted lists for each query word
 - Merge two postings lists → **Linear merge**
- Apply function for matches
 - Boolean: exist / not exist = 0 or 1
 - Ranked: $f(tf, df, length, \dots) = 0 \rightarrow 1$

ink →

3:1

4:1

5:1

wink →

1:1

5:1

Matches

1: f(0,1)

3: f(1,0)

4: f(1,0)

5: f(1,1)

Assignment Project Exam Help

<https://powcoder.com>

Function example: Jaccard coefficient

- a commonly used measure of overlap of two sets A and B
- $jaccard(A, B) = \frac{|A \cap B|}{|A \cup B|}$
 - D1:** He likes to wink, he likes to drink
 - D2:** He likes to drink, and drink, and drink
- $jaccard(A, A) = 1$
- $jaccard(A, B) = 0$, if $A \cap B = \emptyset$
- Example:
 - $D1 \cup D2 = \{\text{he, likes, to, wink, and, drink}\}$
 - $D1 \cap D2 = \{\text{he, likes, to, drink}\}$
 - $jaccard(D1, D2) = \frac{4}{6} = 0.6667$

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

6

Jaccard coefficient: Issues

- Does not consider **term frequency** (how many times a term occurs in a document)
- It treats all terms equally!
 - How about **rare terms** in a collection? more informative than frequent terms.
 - *He likes to drink*, shall “to” == “drink”?
- Needs more sophisticated way of **length** normalization
 - $|D1| = 3$, $|D2| = 1000!$
 - $D1 \rightarrow Q$, $D2 \rightarrow D$

Assignment Project Exam Help

Walid Magdy, TTDS 2020/2021

7

<https://powcoder.com>

Should terms be treated the same?

- Collection of 5 documents (balls = terms)
- Query   
- Which is the least relevant document?
- Which is the most relevant document?

Walid Magdy, TTDS 2020/2021

8

TFIDF

- **TFIDF:**
Term Frequency, Inverse Document Frequency
- **$tf(t,d)$:**
number of times term t appeared in document d
 - As $tf(t,d) \uparrow \rightarrow$ importance of t in $d \uparrow$
 - Document about IR, contains “retrieval” more than others
- **$df(t)$:**
number of documents term t appeared in
 - As $df(d) \uparrow \rightarrow$ importance if t in a collection \downarrow
 - “the” appears in many document \rightarrow not important
 - “FI” is not important word in financial times articles

Assignment Project Exam Help

Walid Magdy, TTDS 2020/2021

9

<https://powcoder.com>

DF, CF, & IDF

- **DF \neq CF** (collection frequency)
 - **$cf(t)$** = total number of occurrences of term t in a collection
 - **$df(t) \leq N$** (N : number of documents in a collection)
 - **$cf(t)$** can be $\geq N$
- **DF** is more commonly used in IR than **CF**
 - **CF** is still used
- **$idf(t)$:** inverse of **$df(t)$**
 - As $idf(t) \uparrow \rightarrow$ rare term \rightarrow importance \uparrow
 - **$idf(t)$** \rightarrow measure of the informativeness of t

Walid Magdy, TTDS 2020/2021

10

Add WeChat powcoder

DF vs CF

he	drink	ink	likes	pink	think	wink	
2	1	0	2	0	0	1	← D1: He likes to wink, he likes to drink
1	3	0	1	0	0	0	← D2: He likes to drink, and drink, and drink
1	1	1	1	0	1	0	← D3: The thing he likes to drink is ink
1	1	1	1	1	0	0	← D4: The ink he likes to drink is pink
1	1	1	1	1	0	1	← D5: He likes to wink, and drink pink ink

5 5 3 5 2 1 2 DF

6 7 3 6 2 1 2 CF

11

<https://powcoder.com>

IDF: formula

$$idf(t) = \log_{10}\left(\frac{N}{df(t)}\right)$$

- Log scale used to dampen the effect of IDF
- Suppose $N = 1$ million →

term	df(t)	idf(t)
calpurnia	1	6
animal	100	4
sky	1,000	3
fly	10,000	2
under	100,000	1
the	1,000,000	0

Walid Magdy, TTDS 2020/2021

12

TFIDF term weighting

- One the best known term weights schemes in IR
 - Increases with the number of occurrences within a document
 - Increases with the rarity of the term in the collection

- Combines TF and IDF to find the weight of terms

$$w_{t,d} = (1 + \log_{10} tf(t, d)) \times \log_{10} \left(\frac{N}{df(t)} \right)$$

- For a query q and document d , retrieval score $f(q, d)$:

$$Score(q, d) = \sum_{t \in q \cap d} w_{t,d}$$

Document Term Vectors with tfidf

	Antony and Cleopatra	Julius Caesar	The Tempest	Hamlet	Othello	Macbeth
Antony	5.25	3.18	0	0	0	0.35
Brutus	1.21	6.1	0	1	0	0
Caesar	8.59	2.54	0	1.51	0.25	0
Calpurnia	0	1.54	0	0	0	0
Cleopatra	2.85	0	0	0	0	0
mercy	1.51	0	1.9	0.12	5.25	0.88
worser	1.37	0	0.11	4.15	0.25	1.95

→ Vector Space Model

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

14

Vector Space Model

- Documents and Queries are presented as vectors
- Match (Q,D) = Distance between vectors
- Example: Q= Gossip Jealous
- Euclidean Distance?
Distance between the endpoints of the two vectors
- Large for vectors of diff. lengths
- Take a document d and append it to itself. Call this document d'.

Assignment Project Exam Help

- "Semantically" d and d' have the same content
- Euclidean distance can be quite large

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

15

<https://powcoder.com>

Angle Instead of Distance

- The angle between the two documents is 0, corresponding to maximal similarity.
- Key idea: Rank documents according to angle with query.
 - Rank documents in increasing order of the angle with query
 - Rank documents in decreasing order of cosine (query, document)
- Cosine of angle = projection of one vector on the other

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

16

Length Normalization

- A vector can be normalized by dividing each of its components by its length – for this we use the L_2 norm:

$$\|\vec{x}\|_2 = \sqrt{\sum_i x_i^2}$$

- Dividing a vector by its L_2 norm makes it a unit (length) vector (on surface of unit hypersphere)
- Effect on the two documents d and d' (d appended to itself) from earlier slide: they have identical vectors after length-normalization.

Long and short documents now have comparable weights

Walid Magdy, TTDS 2020/2021

17

<https://powcoder.com>

Example

- $D1 = \begin{bmatrix} 1 \\ 3 \\ 2 \end{bmatrix} \rightarrow \|\vec{D1}\|_2 = \sqrt{1 + 9 + 4} = 3.74$

- $D1_{normalized} = \begin{bmatrix} 0.267 \\ 0.802 \\ 0.535 \end{bmatrix}$

- $D2 = \begin{bmatrix} 3 \\ 9 \\ 6 \end{bmatrix} \rightarrow \|\vec{D1}\|_2 = \sqrt{9 + 81 + 36} = 11.25$

- $D2_{normalized} = \begin{bmatrix} 0.267 \\ 0.802 \\ 0.535 \end{bmatrix}$

Walid Magdy, TTDS 2020/2021

18

Add WeChat powcoder

Cosine “Similarity” (Query, Document)

- \vec{q}_i is the tf-idf weight of term i in the query
- \vec{d}_i is the tf-idf weight of term i in the document
- For normalized vectors:

$$\cos(\vec{q}, \vec{d}) = \vec{q} \cdot \vec{d} = \sum_{i=1}^{|V|} q_i d_i$$

- For non-normalized vectors:

$$\cos(\vec{q}, \vec{d}) = \frac{\vec{q} \cdot \vec{d}}{\|\vec{q}\| \|\vec{d}\|} = \frac{\vec{q}}{\|\vec{q}\|} \cdot \frac{\vec{d}}{\|\vec{d}\|} = \frac{\sum_{i=1}^{|V|} q_i d_i}{\sqrt{\sum_{i=1}^{|V|} q_i^2} \sqrt{\sum_{i=1}^{|V|} d_i^2}}$$

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

19

<https://powcoder.com>

Algorithm

Add WeChat powcoder

COSINESCORE(q)

```

1  float Scores[N] = 0
2  float Length[N]
3  for each query term  $t$ 
4  do calculate  $w_{t,q}$  and fetch postings list for  $t$ 
5    for each pair( $d, tf_{t,d}$ ) in postings list
6    do Scores[ $d$ ] +=  $w_{t,d} \times w_{t,q}$ 
7  Read the array Length
8  for each  $d$ 
9  do Scores[ $d$ ] = Scores[ $d$ ] / Length[ $d$ ]
10 return Top  $K$  components of Scores[]

```

THE UNIVERSITY
of EDINBURGH

20

TFIDF Variants

Term frequency		Document frequency		Normalization	
n (natural)	$tf_{t,d}$	n (no)	1	n (none)	1
l (logarithm)	$1 + \log(tf_{t,d})$	t (idf)	$\log \frac{N}{df_t}$	c (cosine)	$\frac{1}{\sqrt{w_1^2 + w_2^2 + \dots + w_M^2}}$
a (augmented)	$0.5 + \frac{0.5 \times tf_{t,d}}{\max_t(tf_{t,d})}$	p (prob idf)	$\max\{0, \log \frac{N - df_t}{df_t}\}$	u (pivoted unique)	$1/u$
b (boolean)	$\begin{cases} 1 & \text{if } tf_{t,d} > 0 \\ 0 & \text{otherwise} \end{cases}$			b (byte size)	$1/CharLength^\alpha, \alpha < 1$
L (log ave)	$\frac{1 + \log(tf_{t,d})}{1 + \log(\text{ave}_{t \in d}(tf_{t,d}))}$				

- Many search engines allow for different weightings for queries vs. documents
- SMART** Notation: use notation *ddd.qqq*, using the acronyms from the table
- A very standard weighting scheme is: *Inc.Itc*

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

21

<https://powcoder.com>

For Lab and CW Add WeChat powcoder

Term frequency		Document frequency		Normalization	
n (natural)	$tf_{t,d}$	n (no)	1	n (none)	1
l (logarithm)	$1 + \log(tf_{t,d})$	t (idf)	$\log \frac{N}{df_t}$	c (cosine)	$\frac{1}{\sqrt{w_1^2 + w_2^2 + \dots + w_M^2}}$
a (augmented)	$0.5 + \frac{0.5 \times tf_{t,d}}{\max_t(tf_{t,d})}$	p (prob idf)	$\max\{0, \log \frac{N - df_t}{df_t}\}$	u (pivoted unique)	$1/u$
b (boolean)	$\begin{cases} 1 & \text{if } tf_{t,d} > 0 \\ 0 & \text{otherwise} \end{cases}$			b (byte size)	$1/CharLength^\alpha, \alpha < 1$
L (log ave)	$\frac{1 + \log(tf_{t,d})}{1 + \log(\text{ave}_{t \in d}(tf_{t,d}))}$				

“OR” operator, then:

$$Score(q, d) = \sum_{t \in q \cap d} (1 + \log_{10} tf(t, d)) \times \log_{10} \left(\frac{N}{df(t)} \right)$$

Walid Magdy, TTDS 2020/2021

THE UNIVERSITY
of EDINBURGH

22

Summary of Steps:

- Represent the query as a weighted *tf-idf* vector
- Represent each document as a weighted *tf-idf* vector
- Compute the cosine similarity score for the query vector and each document vector
- Rank documents with respect to the query by score
- Return the top K (e.g., $K = 10$) to the user
